

Appendix 4 Observation Record C: 6th July 2011

Teacher: Claire

Year group: Y2

Number in class: 28

Highlighted text: data extracted for analysis and outcomes

Context:

Mixed ability class solving missing number problems – properties of the equals sign to recognise that the two sides in an equation are the same. Claire wants them to use a ‘finding the difference’ strategy to calculate. Two TAs as support

| | | | | |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes: | <p>Mental maths starter session – shared success criteria: <i>I know I am successful when I can say:</i></p> <ul style="list-style-type: none"> • <i>what I notice</i> • <i>what is the same</i> • <i>what is different</i> <p>On interactive whiteboard selection of numbers – 76, 55, 70, 111, 6, thirty-five, three hundred, two hundred and two</p> | <p>Children discussing what they notice with numbers – moved on to using calculations</p> | <p>Claire brought the class together to go on to the main part of the lesson – shared success criteria: <i>Can I solve a missing number problem? Can I use the equals sign?</i></p> <p>Written on the board: $5 + \square = 17$</p> <p><i>How can we do this?</i></p> | <p>On the whiteboard Claire wrote examples: $6 + 4 = 3 + \square$ $12 + 8 = 15 + \square$ $20 = 15 + \square$ $9 + \square = 2 + 18$</p> <p>Children sat on carpet – still there after 20 minutes – while Claire went through each example</p> |

BMK

| | | | | |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| a) Qualifications | | | | |
| b) Beliefs | <p>Open question given. <i>What is the same and what is different about these numbers?</i></p> <p>Enthusiastic and excited about maths.</p> | <p>Used open questions: <i>What do you notice? What is the same? What is different?</i></p> | <p>Introduced this as an abstract activity – no relation to real-life problem or context.</p> <p>Transmission approach – wanting one method, not</p> | <p>Transmission approach favoured – children not using strategies Claire had hoped for – getting frustrated.</p> |

| | | | | |
|-------------------|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | | valuing other methods given | |
| c) Confidence | Confident use of language – digit, number, place value used and explained | | | Good understanding of importance of inverse operations |
| KTM | | | | |
| a) Connections | Properties of numbers – even, odd, bigger than 100 | Talked about patterns and place value, linked to addition of 222 and 111. | Made a point of linking + and – but didn't build on this | Inverse relationship between + and – emphasised, showed how $5 + \square = 17$ is linked to $17 - 5 = \square$ Asked children to rearrange numbers using fact families. |
| b) Progression | | One child worked out that $300 - 78 = 222$. Claire interested in how he had worked it out using partitioning: $300 - 70 = 230$ $230 - 8 = 222$ | | Jump too quick on to balanced equations – needed to consolidate inverse operations practically. |
| c) Representation | Used interactive whiteboard to display numbers. Language used carefully | | $5 + \square = 17$ Showed 0-20 number line – from 5 counting on to 10 then onto 17. Children struggling with relating to missing number problem. Children used fingers to count on. | Use 100-square next to the list of questions and used it to show counting on. Clear explanations given for two examples – children still counting on their fingers to check answers. |

KLM

| | | | | |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| a) Concepts | Dealt with confusion between digit and number – 222 as 2 hundreds, 2 tens and 2 units – HTU written to support | | Claire not dealing with the different mental methods used. One child knew it was 4 because 6+6 is 12 and 10 is 2 less than this. Not followed up or acknowledged as a useful method. | Reinforcing the = sign as 'is the same as' so that making both sides the same becomes the important concept to focus on |
| b) Interaction | Whole class starter, then allowed children to work in talk partners and small groups to find similarities and differences. Children on-task. | Allowed children to work together in small groups – Claire moving around and talking to individuals | Children giving different methods. Claire asked them to use the inverse, but children not understanding this. | Teacher led discussion – Claire giving most of the methods. |
| | I heard a group talking about a | Quick decision to follow up | Recessed quickly to look at | Realised that children were |

|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes: | Children set tasks in ability groups. LA – worked with TA to make two sides of a number balance equal to show, for example $3 + \square = 9$ MA with TA – Using 'finding the difference to find the missing number' HA – with Claire, using the inverse to find the missing number | Observed HA group working on sheet – challenging questions such as $\square + 14 = 16 + 16$ Needed more consolidation/practice of simpler inverse operations – although worked on this in previous weeks | Claire held up the success criteria – children put smiley face or sad face on their whiteboards to show if they understood. | Children all brought back to the carpet to go through some fact families: $\square + 14 = 16 + 16$ $\square + 14 = 32$ $14 + \square = 32$ $32 - \square = 14$ $32 - 14 = \square$ |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

BMK

| | | | | |
|-------------------|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|--|--|
| a) Qualifications | | | | |
| b) Beliefs | Transmission approach - gave one method for $10 + 20$. <i>Hold 10 in your head and count on in tens.</i> | Non-constructivist – imparting own methods, children not taking ownership of the methods and becoming confused by the use of inverses. | | |
| c) Confidence | | Confident approach – knew what she wanted and clear understanding of method – quick with number operations | | |

Appendix 4 Observation Record C: 6th July 2011

KTM

| | | | | |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|--|--------------------------------------------------------------------|
| a) Connections | Inverse relationship between addition and subtraction. $22 + [] = 30$ $30 - 22 = []$ | Used counting to add on the 100-square | | Linked the equations to fact families |
| b) Progression | | $[] + 14 = 16 + 16$ given to HA group – LA group given balances | | |
| c) Representation | Good use made of bucket balances to represent = in equations. Cubes put in either end to balance – LA group 100-square used by HA – for example to work out $11 + 18$ | LA Group needed balance to make sense of the equations – worked well. | | Used 'mum' and 'dad' to represent fact families – not very helpful |

KLM

| | | | | |
|----------------|---------------------------------------------------------------------------|--|--------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| a) Concepts | | | | |
| b) Interaction | Transmission approach – going through examples showing the method to use. | | Used success criteria to check if children understood – very clear explanation of criteria | Children asked to put their thumbs up if they felt confident to work out $[] + 14 = 16 + 16$. Only 4 children put their thumbs up. |
| c) Response | Good follow up question to suggested answer: <i>How did you know?</i> | | | |
